***Reasons for allowance***

1. Claims 2, 4-8, 10-16 and 18-21 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Foster (of record) shows a receiver in a digital broadcast system comprising a memory device for storing content transmitted in a broadcast signal (fig. 1 item 150, col. 4 lines 10-20, HDDI, the content comprising data files, each file being partitioned into segments that are in the broadcast signal (col. 3 lines 4-15, col. 4 lines 60-67, col. 5 lines 43-67, packets), the signal being provided with at least one header comprising information indicating the number of segments that constitute one of the files, and information identifying the segments (col. 5, lines 40-67, col. 6 lines 38-64, type of data and block size). Foster further shows a reception device for receiving the transmitted broadcast signal and processing the signal to obtain the content including segments corresponding to the data files (see fig. 1), and a processing device connected to the memory device and reception device and being programmable to use at least one header in the transmitted broadcast signal to determine the size of (to allocate) at least one section in the memory for storing the data file (fig. 1, host processor and memory controller, col. 6 lines 50-65; col. 9, lines 1-15, FAT on storage medium), storing the segments of the data file in the allocated section (fig. 1, host processor and memory controller, col. 6 lines 50-65, col. 9 lines 1-15, FAT on storage medium) and to monitor the progress of the allocated section (col. 7 lines 1-471 using interrupts and time stamps to fill buffers that send data to the HDD). Foster further discloses the a buffer size of 512 bytes of audio and video is defined by the MPEG-2 standard; however, the

Art Unit: 2424

size of the buffers are essentially arbitrary and the particular sizes discussed and illustrated should be regarded as exemplary (Col. 5, lines 32-42). Foster further shows that the header file contains identification codes for the segments that indicate the order the segments are to appear in playback (Col. 8 lines 21-67; Col. 9, lines 1-23, STC used for synchronization of playback), and the ability to determine if the segments have been stored (col. 8 lines 15-35, using a buffer that continually adds data until %11, then stores the data together, effectively determining .if and when data Should be stored).

Hiroshima (of record) discloses the use of the packet header data to indicate how much of the memory device need to be allocated to store the data file (see Fig. 6, el. 122; Col. 8, lines 32-45) for the purpose of preventing data loss by allocating corresponding memory size as needed.

Rieger (of record) teaches audio programs being rebroadcast and received multiple times, and that a receiver can use preamble-provided information "to filter out programs recognized as already having been captured" as noted on the decision by the Board of Patent Appeals and Interferences mailed 05/21/2010.

The prior art of record does not teach the following limitations (in conjunction with remaining limitations): identify whether program segments were or were not previously stored as noted on the decision by the Board of Patent Appeals and Interferences mailed 05/21/2010.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

Art Unit: 2424

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
